

Green Planet launches 'neutral' mining subsidiary

Green Planet Group has established a new wholly-owned subsidiary to implement technologies the company and its strategic partners have developed to minimise the environmental impact of precious metals mining.

The new subsidiary, Green Mining Technologies, will utilise patented technologies and processes developed by a Green Planet Group-led consortium of four research and development companies focused on improving the quality of soil, water, and air. The technologies will be utilised by Green Mining Technologies to reduce the environmental impact of ore extraction, processing and transportation, while restoring the land and the environment in and around mining sites.

Green Planet Group and its R&D arm, White Sands, will support the green mining process with the use of its fuel additive and engine treatments, XenTx and XenTx CB.
